## TROUBLESHOOTING

OPERATING ISSUE	RECOMMENDATIONS
Bag is melting.	Start with timer on the lowest setting possible. This will also preserve the heating element.
Sealer is not producing a good seal all the way across.	<ol style="list-style-type: none"><li>1. Place additional pressure on the sealing arm.</li><li>2. Hold the sealing arm down for 2-4 seconds after the sealing light goes out.</li><li>3. Heating element may need to be replaced.</li></ol>
Sealer is not sealing.	Heating element may need to be replaced.
Heating element is burning out too quickly.	Set timer knob to lowest setting that produces a good seal for the bag thickness. Thicker bags need a higher setting. (Always start with a low setting and increase gradually.)
